1. PRODUCT

1.1. RUSTIKOTTA PRIME TILE

1.2. THE FAÇADE LOOKING

RUSTIKOTTA SKIN embraces TEMPIO small format of ceramic ventilated façade. The main aim of small format is to simplify the definition and installation of the façade.

Once installed, RUSTIKOTTA PRIME tiles give the façade an accentuated overlapping looking (ship-lap façade).

1.3. THE TILE

· TEXTURE

RUSTIKOTTA PRIME tiles present an irregular and deep texture:

· DESIGNED FOR IMPROVING INSTALLATION

· GLAZED SIDES

2 glazed sides to ensure the correct view.

 \cdot SCREW HOLES

Each tile has 6 pre-drilled countersunk holes. This countersunk design ensure the correct adaptation of the tiles, keeping the flat surface of the screwed tile.

1.4. MATERIAL

· CHARACTERISTICS OF THE MATERIAL

RUSTIKOTTA PRIME tiles are 100% ceramic tiles. These tiles are CE marked. RUSTIKOTTA PRIME tiles are recyclable material according to ISO 20887:2020.

· WORKING LIFE

· Lifespan: more than 125 years.

2. COLORS

Ceramic is a natural material that results from a natural process (milling of clays and firing process), and for that reason final product can show variations from one production to another. These variations can be related with final color or final texture.

Images and samples should be considered only as illustrative instrument.

COLOURS RANGE:

EK1009 LIGHT GREY FLAMED

EK1038 TAMPICO

EK1014 WHITE SEPTEMBER

3. ADEQUACY OF THE SYSTEM

3.1. VENTILATED FAÇADE

RUSTIKOTTA PRIME tiles are designed as a external ceramic skin of a ventilated façade system. This handbook does not cover any other kind of installation.

3.2. CHARACTERISTICS OF VENTILATED FAÇADE

A ventilated façade is a façade system composed, at least, by four layers. From internal to the external they are: load-bearing structure (building), insulating layer, air chamber and ceramic skin.

The external layer is not airtight or leakproof, it only provides a rain/wind screen and ensures the correct ventilation of the air chamber.

Waterproofing and protection against UV should be solved with the insulating layer (which should be composed by materials with low water absorption)

3.3. ROOF INSTALLATION

Our RUSTIKOTTA SYSTEM is not sealed, joints are not watertight. RUSTIKOTTA PRIME tiles do not protect the building from water (normally roof tiles are placed and designed in order to prevent the water filtration).

In any case, if the problem of water is solved using other elements and RUSTIKOTTA tiles are only used as a decorative element in the roof design. RUSTIKOTTA tiles can be installed on the roof. The adequacy or not, should be checked by the architect of the project.

If the roof is mainly flat, the water accumulation will not be good for TEMPIO tiles. Roof installation is not recommended if the slope of the roof is less than 35%.

4. ALUMINIUM SUBFRAME

4.1. SCOPE

This handbook is based on TEMPIO experience and good practice. Please, take into account that:

• All the instructions included in this handbook are indicative:

- \cdot They should not overrule structural design (defined by the architect/engineer of the façade) or current construction local regulations.
- · They should be adapted/adjusted to the real building.

On the other hand, fixation to the load-bearing structure is not included in this handbook. This should be designed following the local constructions regulations. Load-bearing structure could be the external vertical walls made of masonry (clay, concrete, or stone), concrete (cast on site or as prefabricated panels), timber or metal frame in new or existing buildings (retrofit).

4.2. SYSTEM COMPONENTS

MAIN ELEMENTS:

· VERTICAL PROFILE

Vertical T profile 40x50x3mm

- · Weight: 0,715kg
- · Length of the elements: 3,00m
- · Material: Aluminium 6063 T5 (according to UNE-EN 755-2)

· HORIZONTAL PROFILE

Horizontal omega profile for RUSTIKOTTA PRIME TILES. The slope of this profile has been designed to ensure the correct guidance of the ceramic tile.

- · Weight: 0,535kg/lm
- · Length of the elements: 4,00m
- · Material: Aluminium 6063 T5 (according to UNE-EN 755-2)
- · STAINLESS SELF-DRILLING SCREW

This screw is used to fix the aluminium profiles (vertical and horizontal) with each other. Recommended screw is 5,5x25mm stainless steel A2 self-tapping screw.

· COUNTERSUNK STAINLESS SELF-DRILLING SCREWS

This screw is used to fix the ceramic tile to the horizontal profile and includes an EPDM washer. Recommended screw is 4,5x25mm. This washer prevents rattling and, with it, the noise of the façade.

SECONDARY ELEMENTS:

· STARTER PROFILE

These profiles ensure the second point of support for the first line (bottom) of tiles.

This profile remains hidden and it can not be seen when we see the façade from the front.

· MOUSESTOP PROFILE

This kind of profiles are used to avoid the entrance of animals or plants in the air-chamber of the ventilated façade.

· CORNER PROFILES

Most part of corner solutions requires vertical aluminium profiles. There are a wide range of typologies for this solution, some of them are included in this handbook.

4.3. SETTING IT OUT

It is always recommended to draw the façade before mounting it. Setting the elements out before mounting them will increase the efficiency in the mounting process: ensuring a faster and controlled installation.

We recommend following these steps to draw the façade:

<u>1. FIRST OF ALL</u>

Work with a dimension drawing of the façade.

2. DRAWING VERTICAL PROFILES

2.1. Around corners and window or door cavities we should **respect a dis-tance of (minimum) 70mm**.

2.2. The maximum distance between two vertical profiles is 90cm.

2.3. If the façade is **higher than the length of the vertical profile (3m)**, we **should leave at least 10mm between profiles**, leaving space for aluminium expansion movements.

3. DRAWING HORIZONTAL PROFILES

Although horizontal profiles are 4m length, we do not recommend installing them in lengths exceeding 2000mm. Distance between two horizontal rails consecutives should be at least 5mm.

3.1. Bottom profile

To ensure the correct performance of the ventilated façade, we recommend to install the first tile at least 150mm from the floor.

That means that the first profile should be placed 346mm from the floor.

3.2. Top part of windows and doors

It is recommended to leave at least 10mm between the bottom part of the tile and the window profile.

That means that the horizontal profile should be placed about 216mm upper windows and doors.

205m

Elevation view

Section

3.3. Under the roof and bottom part of windows

It is recommended to leave at least 50mm between the bottom part of the sill element. That means that the horizontal profile should be placed about 78mm down from the windows and top part of the façade.

Elevation view

Section

3.4. Place de horizontal profiles

The distance between horizontal profiles should be 190mm.

190mm between horizontal profiles:

<u>1sqm of façade are 10,5 tiles</u>

Below we attach all the installation details of placing the Rustikotta tiles.

6. AT THE JOB SITE

6.1. STORAGE

The ceramic tiles come palletized without cartoon boxes. Here the general characteristics of the packing:

- Pallet tiles: 216 pieces (21,60sqm)
 Tiles are packed in packages of 4 pieces
 Isqm of façade are 10,5 tiles
- · Pallet weight: **851kg**
- · Pallet size: 75x110x115cm

This packing protects the ceramic material during transport and (if it is in good condition) protects the tiles from the elements. If the plastic is broken, **we recommend to use a extra covering in the jobsite.**

Pallets are stackable for storage (2 rows). We recommend to check that the ground is leveled and it is hard enough before storing the material. A wooden board can be placed between stack pallets to increase the protection of the tiles.

6.2. MANIPULATION (ADJUSTMENT TILES)

RUSTIKOTTA PRIME tiles can be cut and drilled at jobsite to get the sizes needed for the façade. It should be takent into account that:

· CUTTING TILES:

· It is recommended to use a traditional cutter or a water diamond blade.

• <u>Adjustment in length</u>: The final adjustment tile shoud not be smaller than 10cm wide.

• <u>Adjustment in module:</u> The tile should be cut on top part and drill holes afterwards.

• <u>Adjustment in diagonal:</u> Sometimes it is needed to adjust the tiles under a slope.

A TILE:

When the cut allows it, we can fix the tile by two screws.

B TILE:

RUSTIKOTTA TILES are not heavy tiles. When the tile that we need to finish the scheme is too little and it does not admit screws, we can glue it and screw it to the previous tile. We recommend to use a plate behind to ensure the correct adjustment.

· DRILLING TILES:

New holes for installing or adapting project elements.

- It is recommended to use diamond drill bits, refrigerated by water.
- Minimum distance from the hole to the border of the tile, 30mm.

The sut that appears during manipulation process should be eliminated just after the cutting/drilling work.

6.3. PREVIOUS STEPS

· FLATNESS OF THE WALL:

It is always needed to revise the straightness of the substrate. It is recommended to ensure that flatness difference is not more than 3mm in 2m (vertical and horizontal).

6.4. INSTALLATION

Installation shoud be carried out by appropriately qualified staff.

· SUBSTRUCTURE:

Horizontal profiles should be screwed to vertical profiles with two screws at each intersection.

· TILING:

 \cdot Tiles can be picked up directly from the pallet, it is no need of mixing various pallets before tiling to ensure the correct pattern of the design.

 \cdot Tiles should be picked up carefully from the pallet, we should protect the tile from dirt.

· Tiling should begin from bottom line to top line.

• All tiles must be mounted with a minimum of two screws. It is important that the tiles are fastened with the right torque. Torque is determined from a sample mounting and it is checked continuously. Avoid impact drivers to screw the tiles.

6.5. CLEANING

The façade should be cleaned right after installation using high-pressure cold water cleaning.

The engobe on the back side of the tiles can mark the Rustikotta surface in the pallet during transportation. These white marks are only dust and should be removed during the cleaning procedure.

7. MAINTENANCE

7.1. CLEANING PROCEDURES

The main advantage is that **the maintenance** of this type of facade i**s very low**, we could say that it is almost zero.

Depending on the area where the building is placed, dirtiness caused by pollution may appear, especially which is caused by dangerous fumes.

The frequency of this cleaning will depend on the level of dirtiness. The cleaning will be carried out with high-pressure cold water without any industrial solvent.

7.2. TILE REPLACING

1. Cut the damaged tile

2. Reinforce the substructure

Reinforce the anchoring of the new tile using L profiles.

These profiles should be glued to the existing structure/tiles.

3. Glue and screw the new tile to the wall

**NOTE: Façade calculations should be revised by project manager. The text is indicative and must be adapted to the project, as well as the applicable technical requirements/ legislation.
